SUMMARY

Senior Ruby on Rails developer with 18 years experience offers full skills package from frontend to backend and devops. Familiarity with all versions of Rails and Ruby.

EXPERIENCE

WingTask

May 2021 – Present | Ruby on Rails

WingTask is a mobile UI for the popular opensource command line task manager, Taskwarrior. WingTask is an app wholly created by me and represents my desire to build and launch my own app as well as trying to provide a useful addition to a CLI app that I use daily.

1bios

Dec 2018 – Apr 2021 | Ruby on Rails

1bios is a complex set of Ruby on Rails applications that serve different populations of users. It has a web admin area that is mostly Rails and React. It also has a mobile frontend that is React being served from a Rails API. The app is unique in that it's a monorepo containing about 3 or 4 different Rails apps being serviced by a Ruby middle tier library

BidSketch

Feb 2015 – Dec 2017 | Ruby on Rails

Worked on an unreleased app called Docsketch which is an electronic signature signing app similar to HelloSign or RightSignature. Using React I created the ability for a person to drag and drop signing elements onto an uploaded document in order to specify what needs to be executed for the signing.

TaxJar

Dec 2014 – Dec 2015 | Ruby on Rails

Created a ruby client for the TaxJar API. The ruby client made it easy for other ruby devs to pull data from the TaxJar REST API, JSON was the data format returned and that was converted into ruby objects.

Econify

Oct 2014 – Dec 2014 | Ruby on Rails

Econify created an app for selling parts in an Ebay like market for the large machine industries. For instance, it allowed people who had spare parts for locomotive trains to sell parts to one another. I worked generally on fixing bugs and adding features to this marketplace app

EndPoint

Mar 2011 – Sep 2014 | Ruby on Rails

Harvard Law commissioned End Point to build an app called H2O which is a platform for creating, sharing and adapting open course materials. While this app was adapted for many other institutions initially it allowed Harvard Law Professors to upload PDF copies of US court cases that would be part of the curriculum for Harvard Law students. I worked on an annotations feature which allowed a professor to share annotations of a document to their class as well as allowing a student to add their own annotations. There was a versioning component to this that also allowed viewing annotations at different points in time.

Morlen Sinoway

June 2010 – Feb 2011 | Ruby on Rails

Morlen Sinoway wanted an ecommerce site and I created one for them using Spree, a Ruby on Rails ecommerce solution. Taking their designs I wired up the product display, search, and checkout process. The checkout process used payment gateway authorize.net.
